

VS1000 - Datasheet

VS1000 is a high-end capacitive MEMS accelerometer, specially designed for vibration measurements from DC to medium frequencies.

Thanks to low noise, resistance to repetitive high shocks and insensitivity to temperature environments VS1000 guarantees confident and accurate vibration measurements in rugged environments.

Key features

- small LCC 20 hermetic sealed package
- non-linearity < 0,1% FS
- repetitive shock resistance (500 x 1'500g)
- low noise 7 $\mu\text{g}/\sqrt{\text{Hz}}$ (typ. in band, 2g)
- differential output for optimal signal to noise ratio
- embedded self-test, temperature sensor and brownout protection for confidence at all time

Parameter, typical values	VS1002	VS1005	VS1010	VS1030	VS1050	VS1100	VS1200	Unit

Table 7: VS1200 Specifications

Absolute maximum ratings

Absolute maximum ratings are stress ratings. Stresses in excess of these ratings can cause permanent damage to the device. Exposure of the device to the absolute maximum ratings for an extended period may degrade the device and affect its reliability.

Parameter	Comments	Min	Typ	Max	Unit
Supply voltage V_{DD}		-0.3		3.9	V
Voltage at any PIN		-0.3		$V_{DD} +0.3$	V
Operational temperature		-55		+125	°C
Multiple Shock	Functional operation after 500 shocks (0.2ms / half-sine / any axis)			1'500	g
Shock Survivability	Single shock (non-repetitive) 0.15ms half-sine, in one direction (HA, PA or IA axes)			6'000	g
ESD stress	HBM model	-1		1	kV

Pinout description

Figure 37: Pinout top view

Figure 38: Proximity circuit & pull-up/down

The device pin layout is given in Figure 37 and a description of each pin given in the Figure 38. The capacitors C1 (10 µF), C2 (1 µF) and C3 (1 µF) are shown in the Figure 38 and must be placed as close as possible to the VS1000 package and are used as decoupling capacitors and for a proper sensor startup. COG or X7R capacitors @ 5 % are recommended.

Pin Nb.	Pin name	Type	Description
2	RESET	DI, PU	System reset signal, active low
3	POR	DO	Power On Reset
4	OUTP	AO	Differential output positive signal
5	OUTN	AO	Differential output negative signal
6	TEMP	AO	Temperature analog output
7	ERR	DO	Error signal (flag)
14	V _{ss} (0 V)	PWR	Connect to ground plane
15	ST	DI, PD	Self-test activation, active high
16	V _{MID}	AO	Internal ASIC reference voltage. For decoupling capacitors only
17	V _{DD} (3.3 V)	PWR	Analogue power supply
1,8,9,10,11, 12,13,18,19,20	GND	GND	Must be connected to ground plane (GND)

PWR, power / AO, analog output / AI, analog input / DO, digital output / DI, digital input / PD, internal pull down / PU, internal pull up

Table 9: VS1000 pinout description

Electrical Functions description

Introduction

VS1000 has electrical digital function embedded such as Power-On-Reset, External reset, Built in Self-test and Overload error detection. All those functions are described below.

POR (Power-On-Reset) function

The POR block continuously monitors the power supply during startup as well as normal operation. It ensures a proper startup of the sensor and acts as a brownout protection in case of a drop in supply voltage.

During sensor power on, the POR signal stays low until the supply voltage reaches the POR threshold voltage (V_{TH}) and begins the startup sequence (see Figure 39). In case of a supply voltage drop, the POR signal will stay low until the supply voltage exceeds V_{TH} and is followed by a new startup sequence. The ERR signal is high (equal to V_{DD}) until the startup sequence is complete.

Figure 39: Typical sensor power sequence using the recommended circuit

External Reset

An external reset can be activated by the user through the RESET input pin. During a reset phase, the accelerometer outputs (OUTP & OUTN) are forced to $V_{DD} / 2$ and the error signal (ERR) is activated (high), see Figure 40

Figure 40: Typical sensor reset sequence with external reset

Built-in self-Test function

The built-in Self-Test mode generates a square wave signal on the device outputs (OUTP & OUTN) and can be used for device failure detection (see Figure 41).

When activated, it induces an alternating electrostatic force on the mechanical sensing element and emulates an input acceleration at a defined frequency. This electrostatic force is in addition to any inertial acceleration acting on the sensor during self-test; therefore it is recommended to use the self-test function under quiescent conditions.

Figure 41: Built-in Self-test signal on the differential acceleration output (frequency: 24 Hz / amplitude 1g)

Overload and error function

The device continuously monitors the validity of the accelerometer output signals. If an error occurs, the ERR pin goes high and informs the user that the output signals are not valid. An error can be raised in the following cases:

- Out of tolerance power supply (POR low), such as during power on
- During external reset phase (user activation of the reset)
- Temperature overload (if temperature is higher than the specification)
- Under high acceleration overload (e.g. high shock)

Upon a high-amplitude shock, the internal overload circuit resets the electronics and initiates a new startup of the readout electronics. This sequence is repeated until the acceleration input signal returns to normal operation range. This behavior is illustrated on the figure below with a large shock of amplitude 1'500 g: the overload protection is active during the shock and the sensor is fully operational once the acceleration is within the operating range

Figure 42: Accelerometer submitted to a 1'500 g / 0.5 ms shock. The overload protection is active during the shock and the sensor is fully operational once the acceleration is within the operating range.

Dimensions and package specifications

The outline of the LCC20 ceramic package and the Center of Gravity (●) is illustrated in the drawing below.

Figure 43: Package mechanical dimension

Parameter	Comments	Min	Typ	Max	Unit
Lead finishing	Au plating Ni plating W (tungsten)	0.5 1.27 10	1.5 8.89 15	4	µm
Hermeticity	According to MIL-STD-833-G			5·10 ⁻⁸	atm·cm ³ /s
Weight				1.5	grams
Size	X Y Z		8.9 8.9 3.23	9.2 9.2 3.5	mm mm mm
Packaging	RoHS compliant part. Nonmagnetic, LCC, 20 pin housing.				
Proximity effect	The sensor is sensitive to external parasitic capacitance. Moving metallic objects with large mass or parasitic effect in close proximity of the accelerometer (mm range) must be avoided to insure best product performances. A ground plane below the accelerometer is recommended as a shielding.				
Reference plane for axis alignment	LCC must be tightly fixed to the PCB, using the bottom of the housing as the reference plane for axis alignment. Using the lid as reference plane or for assembly may affect specifications and product reliability (i.e. axis alignment and/or lid soldering integrity)				

Table 10: Package specifications

Recommended circuit

In order to obtain the best device performance, particular attention must be paid to the proximity analog electronics. A proposed circuit that includes a reference voltage, the sensor decoupling capacitors and output buffers is described in Figure 44

Optimal acceleration measurements are obtained using the differential output ($OUTP_B - OUTN_B$). If a single-ended acceleration signal is required, it must be generated from the differential acceleration output in order to remove the common mode noise.

Block Diagram & Schematic

The main blocks that require particular attention are the power supply management, the accelerometer sensor electronic and the output buffer. The following schematic shows an example of VS1000 implementation.

Figure 44: Recommended Block diagram & Schematic

Power Supply

The accelerometer output is ratiometric to the power supply voltage and its performance will directly impact the accelerometer bias, scale factor, noise or thermal performance. Therefore, a low-noise, high-stability and low-thermal drift power supply is recommended. Key performance should be:

- Output noise $< 1\mu\text{V}/\sqrt{\text{Hz}}$
- Output temperature coefficient $< 10\text{ppm}/^\circ\text{C}$

The power supply can be used as an output signal (V_{DD_S}) in order to compensate any variation on the power supply voltage that will impact the accelerometer signal (ratiometric output).

The electronic circuit within the accelerometer is based on a switched-capacitor architecture clocked @ 200 KHz. High-frequency noise or spikes on the power supply will affect the outputs and induce a signal within the device bandwidth.

Accelerometer sensor

The sensor block is composed of the VS1000 accelerometer and the 3 decoupling capacitors: C1, C2 and C3. These capacitors are mandatory for the proper operation and full performance of the accelerometer. We recommend placing them as close as possible to the VS1000 package on the printed circuit board.

Output signal conditioning

The output buffer must be correctly selected in order match the VS1000 output impedance and signal bandwidth. The AD8571 is proposed for the acceleration output (OUTP & OUTN) and the temperature output (TEMP).

A technical note related to single ended output is available at www.safran-colibrys.com.

SMD recommendation

A recommended land pattern for LCC20 is shown in the Figure 45. It should be tested and qualified in the manufacturing process. The land pattern and pad sizes have a pitch of 1.27mm and the pin 1 is longer to insure the right orientation of the product during mounting. After assembly, the orientation can be controlled from the top with an extra point printed on the lid which correspond to pin 1.

Figure 45 : LCC20 land pattern recommendation (unit are mm/[inch])

The VS1000 is suitable for Sn/Pb and Pb-Free soldering and ROHs compliant. Typical temperature profiles recommended by the solder manufacturer can be used with a maximum ramp-up of 3°C/second and a maximum ramp-down of 6°C/second: The exact profile depends on the used solder paste.

Figure 46: Soldering Temperature Profile

Phase	Sn/Pb		Pb-Free	
	Duration [sec]	Temperature [°C]	Duration [sec]	Temperature [°C]
Peak	10-30	235-240	20-40	245-250
Fusion	60-150	183	60-150	217
Preheat	60-120	Min : 100 Max : 150	60-180	Min : 150 Max : 200

Table 11: Soldering temperatures & times

The cleaning process of electronic boards sometimes involves ultrasonics. This is strongly prohibited on our sensors. Ultrasonic cleaning will have a negative impact on silicon elements which generally causes damages.

Note: Ultrasonic cleaning is forbidden in order to avoid damage of the MEMS accelerometer

Handling and packaging precautions

Handling

The VS1000 is packaged in a hermetic ceramic housing to protect the sensor from the ambient environment. However, poor handling of the product can induce damage to the hermetic seal (Glass frit) or to the ceramic package made of brittle material (alumina). It can also induce internal damage to the MEMS accelerometer that may not be visible and cause electrical failure or reliability issues. Handle the component with caution: shocks, such as dropping the accelerometer on hard surface, may damage the product.

It is strongly recommended to use vacuum pens to manipulate the accelerometers

The component is susceptible to damage due to electrostatic discharge (ESD). Therefore, suitable precautions shall be employed during all phases of manufacturing, testing, packaging, shipment and handling. Accelerometer will be supplied in antistatic bag with ESD warning label and they should be left in this packaging until use. The following guidelines are recommended:

- Always manipulate the devices in an ESD-controlled environment
- Always store the devices in a shielded environment that protects against ESD damage (at minimum an ESD-safe tray and an antistatic bag)
- Always wear a wrist strap when handling the devices and use ESD-safe gloves

This product can be damaged by electrostatic discharge (ESD). Handle with appropriate precautions.

Packaging

Our device are placed for shipment and SMD process in trays. They are packed in sealed ESD-inner bag. We strongly advice to maintain our device in is original OEM sealed ESD inner-bag to guarantee storage condition before to soldering them.

Glossary of parameters of the Data Sheet

g [m/s²]

Unit of acceleration, equal to standard value of the earth gravity (Accelerometer specifications and data supplied by Safran Sensing Technologies Switzerland use 9.80665 m/s²).

Bias [mg]

The accelerometer output at zero g.

Bias temperature coefficient [mg/°C]

Variation of the bias under variable external temperature conditions (slope of the best fit straight line through the curve of bias vs. temperature).

Scale factor [mV/g]

The ratio of the change in output (in volts) to a unit change of the input (in units of acceleration); thus given in mV/g.

Scale factor temperature coefficient [ppm/°C]

Maximum deviation of the scale factor under variable external temperature conditions.

Temperature sensitivity

Sensitivity of a given performance characteristic (typically scale factor, bias, or axis misalignment) to operating temperature, specified generally at 20°C. Expressed as the change of the characteristic per degree of temperature change; a signed quantity, typically in ppm/°C for scale factor and mg/°C for bias. This figure is useful for predicting maximum scale factor error with temperature, as a variable when modelling is not accomplished.

Non-linearity [% FS]

The maximum deviation of accelerometer output from the best linear fit over the full scale input acceleration. The deviation is expressed as a percentage of the full-scale output (+A_{FS}).

Frequency response [Hz]

Frequency range from DC to the specified value where the variation in the frequency response amplitude is less than -3 dB (or -5 % for vibration sensors).

Resonance frequency [kHz]

Typical resonance frequency of the mounted device.

Noise [µg/√Hz]

Undesired perturbations in the accelerometer output signal, which are generally uncorrelated with desired or anticipated input accelerations.

Axes definition

Input Axis (IA): sensitive axis

Pendulous Axis (PA): Aligned with the proof mass beam and perpendicular to the input axis

Hinge Axis (HA): Perpendicular to the input and pendulous axes

Quality

Safran Sensing Technologies Switzerland is ISO 9001:2015, ISO 14001:2015 and ISO 45001:2018 certified

Safran Sensing Technologies Switzerland complies with the European Community Regulation on chemicals and their safe use (EC 1907/2006) REACH

VS1000 products comply with the EU-RoHS directive 2011/65/EC (Restrictions on hazardous substances) regulations

Recycling : please use appropriate recycling process for electrical and electronic components (DEEE)

VS1000 products are compliant with the Swiss LSPro : 930.11 dedicated to the security of products

Note:

- VS1000 accelerometers are available for sales to professional only
- Les accéléromètres VS1000 ne sont disponibles à la vente que pour des clients professionnels
- Die Produkte der Serie VS1000 sind nur im Vertrieb für kommerzielle Kunden verfügbar
- Gli accelerometri VS1000 sono disponibili alla vendita soltanto per clienti professionisti

Safran Sensing Technologies Switzerland complies with due diligence requirements of the Conflict Minerals Regulation

Disclaimer

Safran Sensing Technology Switzerland (SSTS) reserves the right to make changes to products without any further notice.

Performance may vary from the specifications provided in SSTS' datasheet due to different applications and integration. Operating performance, including long-term repeatability, must be validated for each customer application by customer's technical experts. The long-term repeatability specification expressed in the datasheet is valid only in the defined environmental conditions (cf Long-term repeatability glossary), and the performance at system level remains the customer's responsibility.

The degolding process applied to the products is excluded from SSTS recommendations. And if applied, cancels any products warranty and liability.

USE OF THE PRODUCT IN ENVIRONMENTS EXCEEDING THE ENVIRONMENTAL SPECIFICATIONS SET FORTH IN THE DATASHEET WILL VOID ANY WARRANTY. SAFRAN SENSING TECHNOLOGIES SWITZERLAND HEREBY EXPRESSLY DISCLAIMS ALL LIABILITY RELATED TO USE OF THE PRODUCT IN ENVIRONMENTS EXCEEDING THE ENVIRONMENTAL SPECIFICATIONS SET FORTH IN THE DATASHEET.
